Task: Scraping Location Data for All of Maine's Cities

Script: PhaseTwo/Scraping/zipcode_scraper.py

Data: PhaseTwo/Data/maine_zipcodes.csv

Methodology:

The reason for this scraper was to get all of the zipcodes for every city in Maine so we could populate the location data in the Job table.

The scraper is very simple as the page layout has everything on the same page so I gathered all of the html data from the page, split it to rows and then for each row (city, zip, county), gathered the info and put it to a csv file.

The table generated from this in the SQL database ensures that we can fill the columns for city, zip and county in the Job Table.
